1. Let $x$ and $y$ be integers. Prove that one of the expressions

$$
2 x+3 y \text { and } 9 x+5 y
$$

is divisible by 17 if and only if so is the other.
2. Given a circle and two points $P$ and $Q$, construct a right triangle inscribed in the circle such that its two legs pass through the points $P$ and $Q$ respectively. For what positions of $P$ and $Q$ is this construction impossible?
3. The side lengths of a triangle of area $t$ form an arithmetic progression with difference $d$. Find the sides and angles of this triangle. Specifically, solve the problem for $d=1$ and $t=6$.
